### **Abstract**

Septate uterine is congenital anomaly present when the outside look of the organ is preserved but the cavity is septated by complete or incomplete fibrous septum. Septum is wedge shaped which runs caudally to divide the cavity. Infertility is concerned when this abnormality is encountered. Imaging modalities like Ultrasound (US), hysterosalpingography (HSG) and Magnetic Resonance Imaging (MRI) play an important role in diagnosing this entity. We present such a case of 27-years old female who was investigated for infertility.

**Keywords:** septate uterus; fibrous septum; infertility; MRI
