Abstract

The Clash of Civilizations is a high-impact theory in the interpretation of geo-political conflicts, claims that future conflicts will take place largely in cultural lines between countries and communities. Theory believes that immigration and multiculturalism will lead to the creation of new minorities and ethnicities. This study focuses on it is likely to continue to adhered to idea or strategy that based on that political boundaries should be compatible with cultural borders, internally and externally(Demographic Engineering). Therefore, How will countries face these realities? Is it ready to deal with such crucial issues, which are closely linked with the path of the thorniest issues such as: Security, Immigration and Integration, Multiculturalism and Human rights, Demography and Welfare State? The research methodology is based on dialectical relationship between demography and migration, culture, economy and politics, that reflect reality of systematic variation in the assessment. So we need to new horizons of social theories because it seems that the traditional basis of sociology and political science study are outdated. thus requires the focus must be on study of material and cultural movement. The results will revealed that demography problematics (since it contains a new threat to states) can not be understood without the presence of a new kind of political analysis, and new vision (which must be based on the cultural dimension) to be more accommodated to developments. This study suggests that remaining possibilities of optimism or pessimism in global demographic level will subject to the balance of interests between countries. It will depend on to find solutions or explanation for dialectical that will be faced by States in the future: How can we adopt principles of the free market economy to strengthen welfare state and in contrast at the political level, we want to stay in a closed club on itself, culturally and nationally, perhaps we may reach stage of biological closure with Biotechnology Revolution in Genetics(genetic engineering)?

Keywords: International Relations, Demography, Migration, Welfare State, Global Security, Europe, Multiculturalism, Genetics.
