Abstract

Reduction techniques is still an open area to be explored in knowledge management which focuses on uncertain data removing unlike comparisons which based optimal and a sub optimal parameters weights using rough sets theory and soft set theory. We define a spatial order of best criterion for selection which based on A combination of A framework of Decision Making Based on Maximal Supported Sets and Hybrid reductions which applies A framework of decision making then Hybrid reduction. The proposed technique, it reduces the table size which shows better reduction compared to Hybrid reduction in terms of sub optimal reduction. As part of this proposal, a comparison test with previous techniques of reduction. The conclusion part which shows better alternative result through our model Special reduction.
